

Perception takes time. The eye catches the drone, but the signal still has to reach the brain before you can aim. By then the drone has moved, so you shoot at where it was. **Robots and drones have the same lag.** Raw sensor data crosses memory and the CPU before the AI can act, and the gap grows with every sensor added.

PROGRAMMABLE NEAR-SENSOR COMPUTING FOR PHYSICAL AI

Physical AI acts on where the world was, not where it is.

Sensor counts keep rising: 10–15 in a phone, 60–100 in a car, up to 25,000 in an aircraft. RiDM builds **DODA**, a runtime-programmable dataflow processor that sits beside the sensors and hands the AI fused, reduced data, so machines act on where the world is now.

Meet DODA

Dynamically Orchestrated Dataflow Architecture: A processor built for heavily repetitive work such as sensor-data pre-processing.

10× faster than a CPU

1/100 of the power

Invented at NUS by the RiDM founders. Three PCT patent families filed by NUS, licensed to RiDM.

Who's building it

3 PhD researchers · Singapore

2 silicon engineers · Korea

Singapore leads core IP development in architecture

Korea leads the tape-out: IC design, SoC integration and MPW shuttles.

What's next

JUNE 2027 · FIRST TAPE-OUT
DODA silicon in 28nm.

H2 2027 · CLIENT TESTING
In potential clients' systems, against their current pipeline. Then first design wins.

Looking for

PoC PARTNERS
Teams that gain directly from DODA, as a chip or an FPGA overlay. High-precision robotics is a natural fit.

STRATEGIC INVESTORS
Capital plus access to robotics, sensing or semiconductor customers.

Invested by

QRT · The Invention Lab · NUS National University of Singapore

TIPS secured. Korean government R&D grant for tech startups.
